

Front-End Web Development

Bootstrap

Today's Learning Objectives

In this lesson, you will:

- Use the Bootstrap CSS library to leverage pre-styled components.
- Adapt Bootstrap components for specific use cases.
- Evaluate CSS frameworks against self-written CSS.

Front-End Web Development

CSS Frameworks

Frameworks

Frameworks are sets of pre-made HTML/CSS/JS components packaged together.

Think of a framework as a bunch of plugins made by the same team that so they work nicely together out of the box.

Should I Use a CSS Framework Like Bootstrap?

Benefits

- Gives you lots of code.
- Grid-based design out of the box.
- Easy integration of JS components.
- Familiar, standard design feel.

Drawbacks

- Gives you lots of code.
- Bloats your site with features you likely won't use.
- Design monotony.

Framework != Instant Boost

"Oh man, I'm getting all this code for free, so I don't have to spend as much time learning how to do things."

— Dangerous Developer Thoughts, Volume XVII

Frameworks will **slow you down** until you learn how to use them.

When you choose to use a framework, you're embracing patterns created by other developers. It takes time to learn these patterns.

Common Frameworks

Bootstrap: <http://getbootstrap.com/>

Foundation: <http://foundation.zurb.com/>

Material Design Lite: <https://getmdl.io/>

Front-End Web Development

Using Bootstrap

Bootstrap

- The most popular framework.
 - Standard-feeling style
- Responsive grid system.
 - Easy, built-in breakpoints
- Plug-and-play components.
 - Navbars, modals, carousels...

Grid-Based Design

- Bootstrap sets up a series of 12 columns that automatically respond to screen size.

Bootstrap Grid

- You can create boxes that clip into the grid and take up 1–12 columns.

Bootstrap Grid

All content should be placed within grid columns. Build column classes using the following formula:

col-{screen-size}-{width}

Examples of Bootstrap column classes:

<code><div class="col-md-6"></code>	A div for medium-sized screens that is 6 columns wide.
<code><div class="col-xs-2"></code>	A div for extra-small screens that is 2 columns wide.

Bootstrap Rules of the Grid

- Columns must be placed into an element with the **row** class to create horizontal groups.
- The total column widths in a row must add up to 12.
 - If you don't define specific numbers, Bootstrap will divide the columns equally.
- **row** must be placed within a parent with the class of:
 - **.container** (fixed-width), or;
 - **.container-fluid** (full-width) for proper alignment.

Bootstrap Grid

The grid structure is very similar to what we've done:

<code><div class="container"></code>	Top-level element; holds all other code.
<code><div class="row"></code>	<ul style="list-style-type: none">● Horizontal row used to hold col elements.● Must be the child of a container.
<code><div class="col"></code>	<ul style="list-style-type: none">● Used to hold content (text/images/etc.).● Must be the immediate child of a row.

All Together

This is how you Bootstrap:

```
<div class="container">  
  <div class="row">  
    <div class="col">  
      Your content here.  
    </div>  
    <div class="col">  
      Your content here.  
    </div>  
  </div>  
</div>
```

Discussion:

How Would We Make This Layout?

Check out the CodePen below to see grid breakpoints in action!

Front-End Web Development

Bootstrap Components

Components Made Easy

Bootstrap has a solid set of standard components that can easily be dropped into your site:

- Navigation bars
- Modals
- Image carousels
- Dropdown menus
- And so much more!

Bootstrap Nav

You've definitely seen the Bootstrap **navbar** before!

```
<nav class="navbar navbar-default" role="navigation">
  <div class="container">
    ...
  </div>
</nav>
```

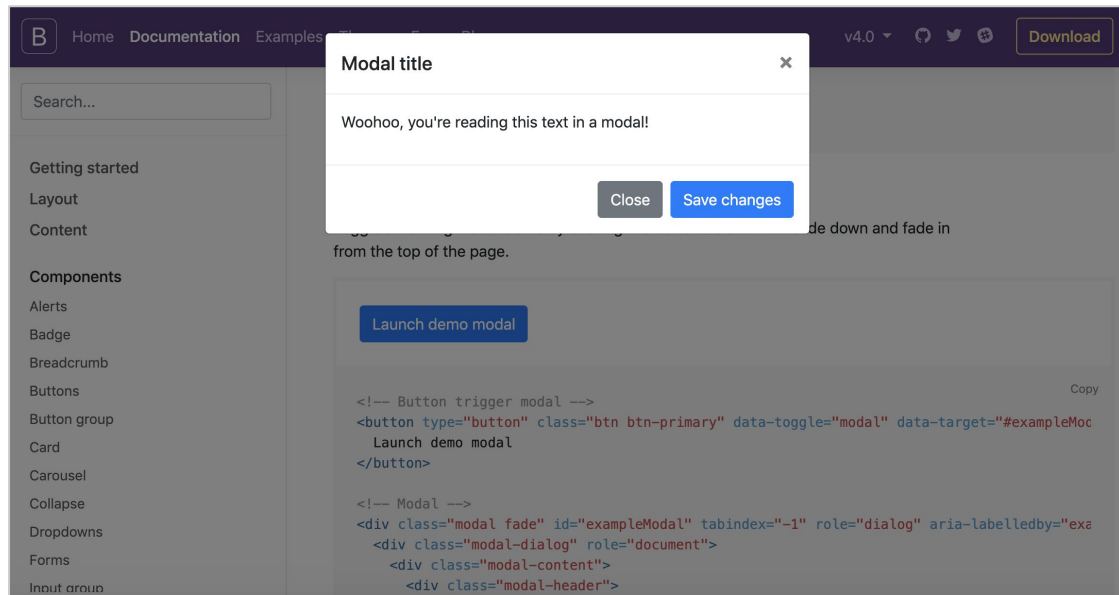

[Home](#) **[Documentation](#)** [Examples](#) [Icons](#) [Themes](#) [Expo](#) [Blog](#)

Modals: Pop Ups for Good, not Spam!

Modals allow content to be focused in a pop-up window on top of other content.

They can be toggled with JavaScript in reaction to any event, typically responding to button clicks.

This CodePen uses a navbar, carousel, cards, and modals to create a standard layout on the home page.

Front-End Web Development

Styles

(Without the Pain and Suffering of Tweaking It Yourself)

Responsive Images

Creating responsive images is as easy as adding this class to your image:

.img-responsive

This class gives us the following code:

max-width: 100%;

height: auto;

Stylized Images

Check out these puppies:

```
  
  

```

- **img-rounded** creates rounded rectangles.
- **img-circle** turns images into circles.
- **img-thumbnail** puts a nice border around images.

Buttons

<http://getbootstrap.com/css/#buttons>

```
<!-- Standard button -->
```

```
<button type="button" class="btn btn-default">Default</button>
```

We can change button color and size very easily. Follow that link to see how.

Group Exercise:

Recreate a Bootstrap Site

Identify a site using Bootstrap and attempt to recreate it. There are many resources that list sites that use Bootstrap, or you can check your favorite sites for Bootstrap-style layouts and components.

<https://expo.getbootstrap.com/>

Key Takeaways

CSS Frameworks Are a Trade-Off

- You get pre-built style and components in exchange for learning and using their exact patterns.
- Frameworks can add unnecessary bloat to a site.

For Next Time

Developer Tools

- The command line provides a direct interface with more powerful control over your computer.
- Git and GitHub are industry-standard tools for version control.
