

Front-End Web Development

Homework 2

Homework Assignment

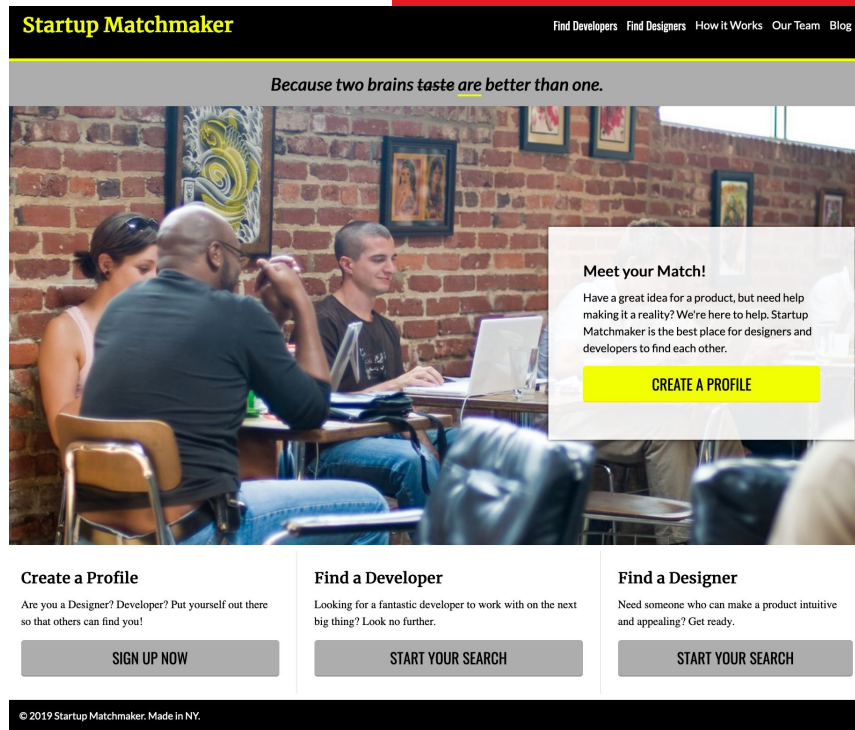

In this homework you will:

- Build HTML and CSS layouts with Flexbox.
- Strategize a layout by creating a wireframe.
- Style a full website from start to finish.

Assignment: Startup Matchmaker

Your first assignment in this class is to make build a site for your first pseudo-client: Startup Matchmaker.

We'll still give you content and colors and fonts like the last assignment, but this time the team has a designer and wants you to match their look and feel.

Explore the Startup Matchmaker BEFORE You Build

If you learn better by working backward from a complete example, explore the solution here:

<https://codepen.io/GAmarketing/live/dyPoeja>

Start by drawing out a wireframe for the site based on the layout picture you've been given. Consider which sections might be semantically grouped inside of a container element, such as a `<section>` or `<div>` tag.

Your Next Step Up

This is a fairly real-world scenario — building out a page from scratch. We've given you the tools you need to get started. You can work with a classmate, but you should each turn in your own assignments. Good luck!
